# 1 Data

## 1.1 Detailed Explanation

We have district-level panel data for the 11 districts (Merz) of Armenia from the years 2004 to 2023. It consists of variables from aggregated national household surveys, variables on detailed agricultural output and drought-related variables. Every variable represents the average level in a particular year in a particular district.

Our main drought measuring tool is the Standardized Precipitation Evapotranspiration Index, which is a multi-scalar drought index that allows a comparison with respect to normal long term conditions. We then multiply it by (-1) in order to make interpretation of the regression coefficients easier. It follows a Standard Normal Distribution with  $sd = 1$ . A value of +0.8 to +1.2 should occur around once or twice in 10 years. It can be calculated over multiple durations. Here we use the SPEI-3 which represents the water balance over the last 3 months.

We use data from the Global Drought Observatory to calculate our values. The standard way of expressing it is geo-spatial data with pixels corresponding to certain coordinates. Then we use the District polygons of Armenia's Merz to select all SPEI pixels touched by the district and average them out to calculate the value of the district. As the SPEI is recalculated every 10 days we then transform these values into different indicators. First we average out per year and district to get the value mean SPEI. This tells us the average deviation from the long term 3 month water balance per year and is the main SPEI variable we use in our regressions. Furthermore, we create two dummies based on this index. Dummy drought 1 is equal to 1 if there were at least 10 observations in a row with an SPEI value above +1. which would correspond to a 90 day period where the water balance was in moderate drought conditions. A second dummy is equal to 1 if there are 15 observations below -1 in a year. They do not have to be consecutive.

Our measure for agricultural stress is based on the VHI index, which is computed from meteorological satellite data. It can detect plants that wilt or show unusual colors and drops the index if it is the case.

### 1.1.1 Variable Names & Units

- In Armenian Dram (currency):
  - income: Household income
  - agric\_income: Household agriculture income
  - fdcons: Household food consumption
  - fdpurch: Household food purchases
  - exp: Household expenditures
- In Percentage:
  - poverty: Rate of households in poverty
  - urban: Rate of households living in an urban area
  - share: Share of observations of SPEI above +1
  - agric\_stress: Percentage of arable areas with a VHI (Vegetable Health Index) value below 35%
- Dummies:
  - drought\_dummy1: Equals 1 if there are at least 10 SPEI observations above +1
  - drought\_dummy2: Equals 1 if there are at least 15 SPEI observations above +1
- Tons (1000kg)
  - agric\_output: Gross Agriculture output
  - grains\_harvest: Tons of grains and leguminous plants harvested
  - vegetables\_harvest: Tons of vegetables harvested
  - fruits\_harvest: Tons of fruits and berries harvested

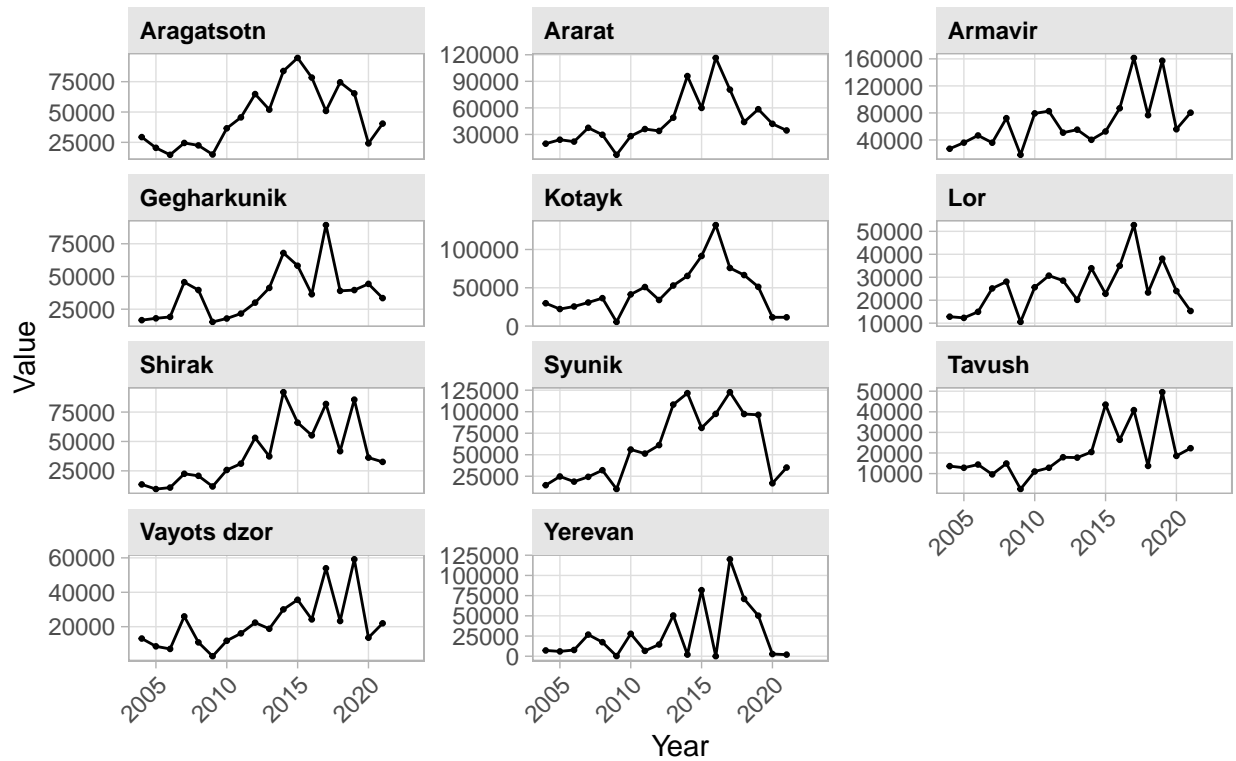

- potatoes\_harvest: Tons of potatoes harvested
  - watermelon\_harvest: Tons of watermelons harvested
  - grapes\_harvest: Tons of grapes harvested
- Hectare (10000m<sup>2</sup>)
  - grains\_area: Hectares used for harvesting grains and leguminous plants
  - vegetables\_area: Hectares used for harvesting vegetables
  - fruits\_area: Hectares used for harvesting fruits and berries
  - potatoes\_area: Hectares used for harvesting potatoes
  - watermelon\_area: Hectares used for harvesting watermelons
  - grapes\_area: Hectares used for harvesting grapes
- Tons per hectare (1000kg / 10000m<sup>2</sup>)
  - output\_per\_field\_grains: Grains harvested divided by area (yield)
  - output\_per\_field\_vegetables: Vegetables harvested divided by area (yield)
  - output\_per\_field\_fruits: Fruits harvested divided by area (yield)
  - output\_per\_field\_potatoes: Potatoes harvested divided by area (yield)
  - output\_per\_field\_grapes: Grapes harvested divided by area (yield)
- Other:
  - spei: SPEI measures deviation of the water balance from the long term mean. A value of 0 means we are at the long term mean, while +1 is a moderate drought that happens once or twice in 10 years. Note that we took the official SPEI and multiplied it by (-1) in order to adjust the coefficient sign interpretation in the regressions. Positive values indicate harsher conditions.
  - temperature: CRU land-based measure of average surface temperature in Celsius

## 1.2 Descriptive Evidence

### 1.2.1 Raw Data Graphs

## Evolution of: Household Agricultural Income

## Evolution of: Gross Agricultural Output

## Evolution of: Household food Consumption

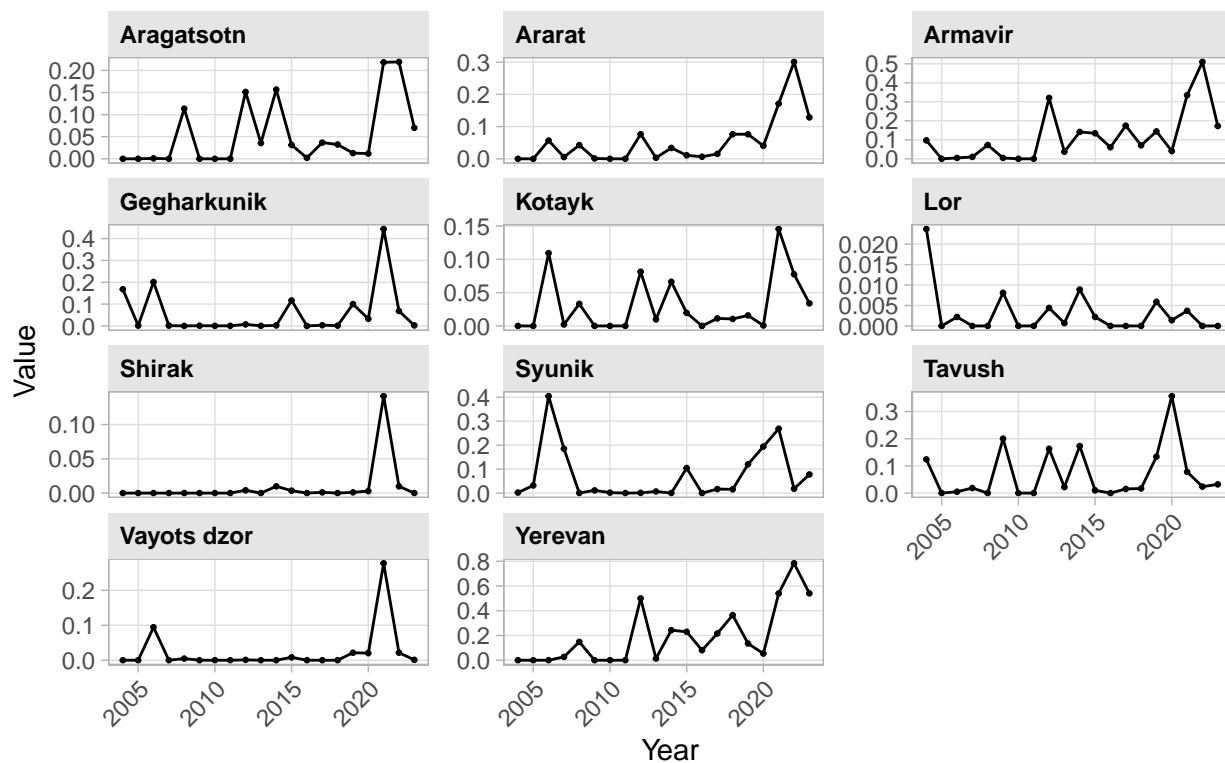

### Evolution of: SPEI (Drought Index)

### Evolution of: Share of observations of SPEI above +1

## Evolution of: Agricultural Stress

## Evolution of: Total Rainfall

## Evolution of: Fruits Harvest

## Evolution of: Fruits Yield

## Evolution of: Grains Harvest

## Evolution of: Grains Yield

### Evolution of: Vegetables Yield

### Evolution of: Potatoes Yield

### 1.2.2 Graphs with Drought Dummy

#### Impact of Drought on Agricultural Output

*Note: This graph should be interpreted with caution as the number of districts is very low, meaning that any kind of visible relationship is very likely due to confounding.*

### 1.2.3 Graphs with Drought Dummy and Quartiles

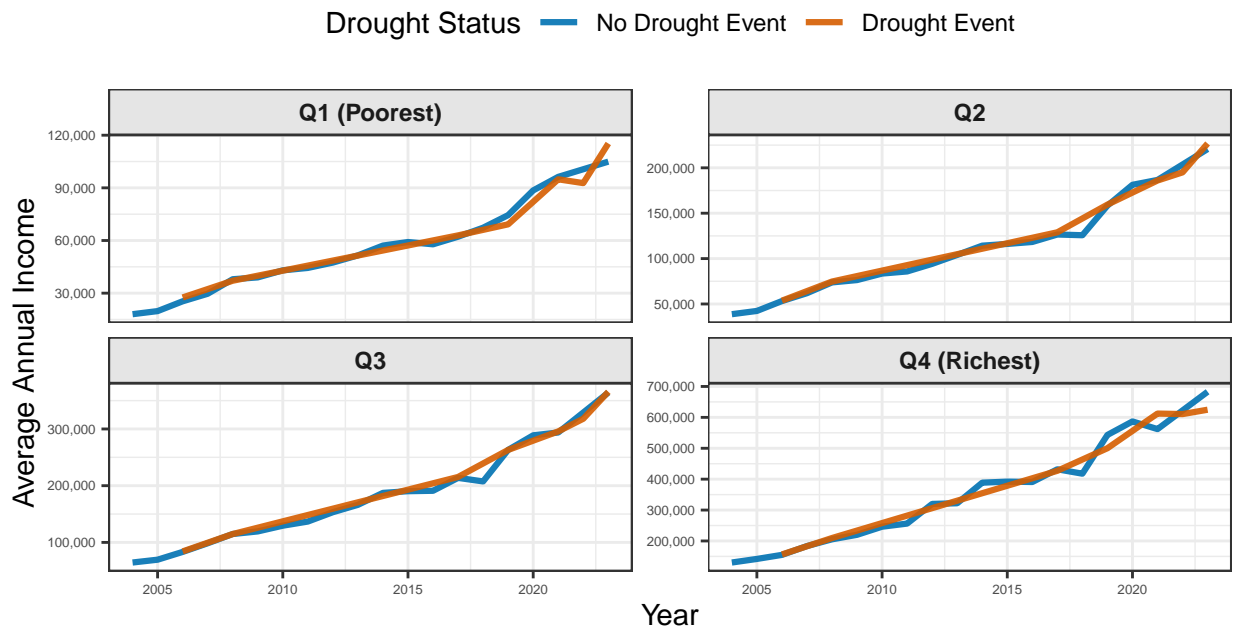

#### Average Income by Income Quartile Over Time

Averaged across all districts

#### Impact of Drought Events on Income, by Income Quartile

Average income trends faceted by income group

## 2 TWFE Regressions

### 2.1 Data

#### 2.1.1 Variable Units

- Armenian Dram (currency):
  - Income
  - Agriculture income
  - Food consumption
- Tons (1000kg)
  - Agriculture output
  - Grains harvest
  - Vegetables harvest
  - Fruits harvest
  - Potatoes harvest
- Tons per hectare (1000kg / 10000m<sup>2</sup>)
  - Grains output per field
  - Vegetables output per field
  - Fruits output per field
  - Potatoes output per field

## Dependent variables are in logs.

### 2.2 Regressions

#### 2.2.1 Equation

All our regressions resemble the following equations, where  $Y_{dt}$  represents the chosen outcome variable for district  $d$  at time  $t$ ,  $\lambda_d$  represents the district-specific fixed effect,  $\gamma_t$  represents the time-specific fixed effect,  $X_{dt}$  is the chosen explanatory variable,  $\beta$  is the effect of said variable on the outcome, and  $\epsilon_{dt}$  is the error.

$$Y_{dt} = \alpha + \lambda_d + \gamma_t + \beta X_{dt} + \epsilon_{dt}$$

$$Y_{dt} = \alpha + \lambda_d + \gamma_t + \beta_1 X_{dt} + \beta_2 X_{d,t-1} + \epsilon_{dt}$$

$$Y_{dt} = \alpha + \lambda_d + \gamma_t + \beta_1 X_{dt} + \beta_2 X_{d,t-1} + \beta_3 X_{d,t-2} + \epsilon_{dt}$$

## 2.3 Dependent Variable: Household Income

### 2.3.1 Regressed on: Drought Index (SPEI)

Dependent Variable: Model:	Household Income
