require(sandwich) #regression errors
require(readxl) #for reading excel data
require(tidyr) #data
require(tidyverse) #data
require(did) #DiD (support staggered treatment)
require(panelView) #for panel data treatment visibility
require(modelsummary) #for nice DiD tables
require(fixest) #TWFE regression

latex_format = TRUE

getwd()
setwd("...")
set.seed(123)
```

2   Data Load

```r
load("final_data.Rdata")
load("final_data_quartiles.Rdata")
load("final_data_deciles.Rdata")
load("final_data_household.Rdata")
```

3 Descriptive Evidence

3.1 Graph 1

```r
# Prepare data
plot_data1 <- dataset %>%
  pivot_longer(cols = c(income, agric_income, agric_output, crops_output, poverty),
    names_to = "metric",
    values_to = "value" )

plot_data2 <- dataset %>%
  pivot_longer(cols = c(spei, share, agric_stress, Total_Rainfall, crops_land),
    names_to = "metric",
    values_to = "value" )

# Plot
ggplot(plot_data1, aes(x = year, y = value, color = metric)) +
  geom_line(aes(group = metric)) +
  geom_point(size = 0.5) +
  facet_grid(metric ~ district, scales = "free_y") +
  labs(
    title = "x and SPEI Over Time by District",
    x = "Year",
    y = "Value (Scales Vary by Row)") +
  theme_minimal() +
  theme(
    axis.text.x = element_text(angle = 45, hjust = 1))
```

x and SPEI Over Time by District

```
ggplot(plot_data2, aes(x = year, y = value, color = metric)) +
  geom_line(aes(group = metric)) +
  geom_point(size = 0.5) +
  facet_grid(metric ~ district, scales = "free_y") +
  labs(
    title = "x and SPEI Over Time by District",
    x = "Year",
    y = "Value (Scales Vary by Row)") +
  theme_minimal() +
  theme(
    axis.text.x = element_text(angle = 45, hjust = 1))
```

x and SPEI Over Time by District
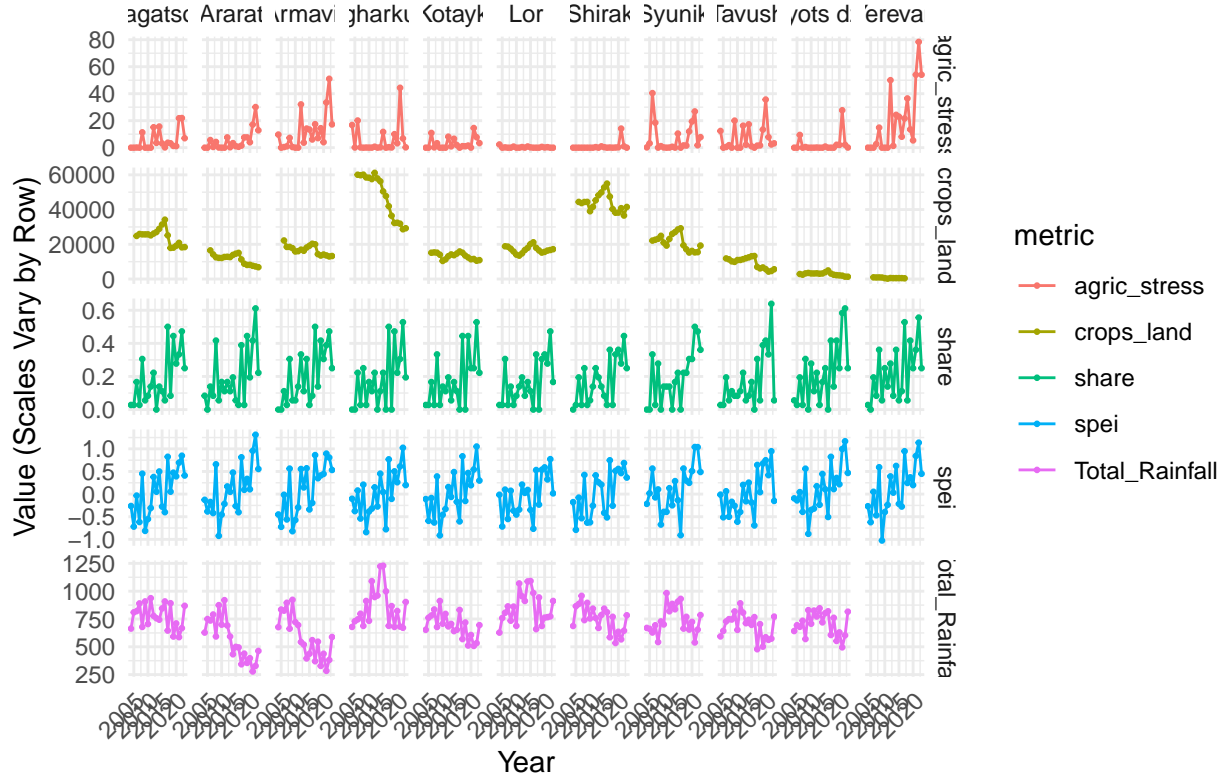

3.2 Graph with Drought Dummy

```r
# Compute, for each years, the mean of agricultural output between districts
#  that experience drought vs no drought
agric_plot <- dataset %>%
  group_by(year, drought_dummy) %>%
  summarise(mean_agric = mean(agric_output, na.rm = TRUE), n_district = n())

ggplot(agric_plot, aes(x = year, y = mean_agric,
                       color = factor(drought_dummy), group = factor(drought_dummy))) +
  geom_line(linewidth = 0.8) +
  geom_point(size = 1.2) +
  scale_color_manual(values = c("0" = "#0072B2", "1" = "#D55E00"),
                     labels = c("No Drought", "Drought")) +
  labs(x = "Year", y = "Mean Agricultural Output", color = "Drought Status",
       title = "Impact of Drought on Agricultural Output") +
  theme_minimal() +
  theme(legend.position = "top",
    axis.text.x = element_text(size = 5),
    axis.text.y = element_text(size = 5),
    plot.title = element_text(size = 20, face = "bold", hjust = 0.5),
    strip.text = element_text(size = 4, face = "bold"))
```

Impact of Drought on Agricultural Output

Drought Status ●— No Drought ●— Drought
3.3 With Quartiles

```r
# Data Prep
dataset_prepped_q <- dataset_quartiles %>%
  mutate(drought_status = factor(drought_dummy,
                         levels = c(0, 1),
                         labels = c("No Drought Event", "Drought Event")),
         income_quartile = factor(national_quartile,
                         levels = c(1, 2, 3, 4),
                         labels = c("Q1 (Poorest)", "Q2", "Q3", "Q4 (Richest)")))

# A1. Aggregate the data: Find the mean income for each year and quartile
plot1_data_q <- dataset_prepped_q %>%
  group_by(year, income_quartile) %>%
  summarize(avg_income = mean(income, na.rm = TRUE),
            avg_agr_income = mean(agric_income, na.rm = TRUE), .groups = 'drop')

# A2. Create the plot q
ggplot(plot1_data_q, aes(x = year, y = avg_income, color = income_quartile, group = income_quartile)) +
  geom_line(linewidth = 1.2, alpha = 0.8) +
  geom_point(size = 2) +

  # --- Aesthetics & Labels ---
```

```r
scale_y_continuous(labels = scales::comma) + # Formats y-axis labels (e.g., 50,000)
scale_color_brewer(palette = "RdYlBu", direction = -1) +
labs(
  title = "Average Income by Income Quartile Over Time",
  subtitle = "Averaged across all districts",
  x = "Year",
  y = "Average Annual Income",
  color = "Income Quartile") +
theme_minimal() + theme(legend.position = "bottom")
```

Average Income by Income Quartile Over Time
Averaged across all districts

```r
# B1. Aggregate data: Mean income by year, quartile, AND drought status
plot2_data_q <- dataset_prepped_q %>%
  group_by(year, income_quartile, drought_status) %>%
  summarize(avg_income = mean(income, na.rm = TRUE),
          avg_agr_income = mean(agric_income, na.rm = TRUE), .groups = 'drop')

# B2. Create the faceted plot q
ggplot(plot2_data_q, aes(x = year, y = avg_income, color = drought_status, group = drought_status)) +
  geom_line(linewidth = 1.1, alpha = 0.9) +

  # Create 4 separate plots, one for each 'income_quartile'
  facet_wrap(~ income_quartile, scales = "free_y") +

  # --- Aesthetics & Labels ---
```

```
scale_y_continuous(labels = scales::comma) +
scale_color_manual(values = c("No Drought Event" = "#0072B2", "Drought Event" = "#D55E00")) +
labs(
  title = "Impact of Drought Events on Income, by Income Quartile",
  subtitle = "Average income trends faceted by income group",
  x = "Year",
  y = "Average Annual Income",
  color = "Drought Status") +
theme_bw() + # A clean theme
theme(
  legend.position = "top",
  strip.background = element_rect(fill = "grey90"), # Style the facet labels
  strip.text = element_text(face = "bold") )
```

Impact of Drought Events on Income, by Income Quartile
Average income trends faceted by income group
4 TWFE Regressions

4.1 Data Subset Selection

```r
# Base case
twfe_data = dataset

# Taking logs for all dependent variables
twfe_data$income = log(twfe_data$income)
twfe_data$agric_income = log(twfe_data$agric_income)
twfe_data$agric_output = log(twfe_data$agric_output)
twfe_data$crops_output = log(twfe_data$crops_output)

twfe_data$grains_harvest = log(twfe_data$grains_harvest)
twfe_data$vegetables_harvest = log(twfe_data$vegetables_harvest)
twfe_data$fruits_harvest = log(twfe_data$fruits_harvest)
twfe_data$potatoes_harvest = log(twfe_data$potatoes_harvest)

twfe_data$output_per_field_grains = log(twfe_data$output_per_field_grains)
twfe_data$output_per_field_vegetables = log(twfe_data$output_per_field_vegetables)
twfe_data$output_per_field_fruits = log(twfe_data$output_per_field_fruits)
twfe_data$output_per_field_potatoes = log(twfe_data$output_per_field_potatoes)

# Excluding Yerevan
#twfe_data = subset(dataset, district != "Yerevan")

# Selecting majority-rural districts
#twfe_data = subset(dataset, urban < 0.5)

# Selecting the poorest income decile
#twfe_data = subset(dataset_deciles, national_decile == 1)

# Selecting the poorest income quartile
#twfe_data = subset(dataset_quartiles, national_quartile == 1)

# Selecting poorer regions
#twfe_data = subset(control, poverty > 0.3)

# Selecting a certain timeframe
#twfe_data = subset(control, year > 2015)
```

4.2 Regression Loop

```r
# 1. Define dependent variables
dependent_vars <- c("income", "agric_income", "agric_output", "crops_output",
                    "grains_harvest", "vegetables_harvest", "fruits_harvest",
                    "potatoes_harvest", "output_per_field_grains",
                    "output_per_field_vegetables", "output_per_field_fruits",
                    "output_per_field_potatoes")
```

```r
# 2. Define independent variables as a list of groups
iv_groups <- list(
  "SPEI" = c(
    "spei",
    "spei + spei_lag1",
    "spei + spei_lag1 + spei_lag2"),
  "Share" = c(
    "share",
    "share + share_lag1",
    "share + share_lag1 + share_lag2"),
  "AgricStress" = c(
    "agric_stress",
    "agric_stress + agric_stress_lag1",
    "agric_stress + agric_stress_lag1 + agric_stress_lag2") )

# 3. Define names
model_names <- c(
  "Model 1: 0 Lags",
  "Model 2: 1 Lag",
  "Model 3: 2 Lags")

# 4. Loop for each dependent variable for each group of independent variables
for (dv in dependent_vars) {

  # Create a latex version of the dv name
  dv_safe <- gsub("_", "\\\\_", dv)
  cat(paste0("\n\n\\subsection{Dependent Variable: ", dv_safe, "}\n\n"))

  for (group_name in names(iv_groups)) {
    cat(paste0("\n\n\\subsubsection{Regressed on: ", group_name, "}\n\n"))

    models_list <- list()
    current_iv_formulas <- iv_groups[[group_name]]

    for (i in 1:length(current_iv_formulas)) {
